Re: Carlisle Closed Cell Spray Polyurethane Foam to Soil or Prepared Base

To Whom It May Concern:

Spray polyurethane foam is a versatile and well tested product for a variety of applications. Use of Carlisle Spray Foam Insulation closed cell spray foams, such as Sealtite Pro Closed Cell, may be used in many application under concrete or below grade. These applications include, but are not limited to:

- Compacted select fill or other compacted soil
- Prepared base (e.g. gravel, granite, sand) for use below concrete flatwork
- Prepared base (e.g. gravel or other select fill) for use below structural concrete slabs

Please note that in areas where there is higher soil moisture content or a high water table, it may be advisable to use polyethylene sheeting or compacted gravel on top of prepared base prior to the spray foam application. The thickness and type of sheeting may depend on climate zone or soil type.

Please feel free to reach out if there are any additional questions or concerns.

Sincerely,
